Abstract: The mandate and competence of the International Monetary Fund (IMF) does not cover food and agriculture policies. While there is anecdotal evidence that the IMF engages in these policies regardless, the state-of-the-art lacks a systematic empirical foundation to identify the extent of its mission creep into these sectors. Based on a combination of machine and human coding, we present a comprehensive database on the IMF's policy interventions in food and agriculture. Using new data on 'conditionalities'—policies that governments must implement to access IMF credit—we assess to what extent the IMF has targeted these sectors for the period 1980 to 2014. Our analysis evaluates the agricultural content and ideological orientation of conditions according to whether they promote a developmental state, a night-watchman state, or neither. We find about 2% of all IMF conditions (1,105 of 58,406) directly target food and agriculture issues. These are present in 43% of all IMF programs (332 of 781); and affect 100 countries (of the 131 countries that have had an IMF agreement). In addition, our analysis reveals that 59.2% of these conditions embody policy measures in line with night-watchman state policy preferences, 40.1% are model-neutral, and 0.7% developmental. Within the model-neutral category, 23.9% are conditions oriented towards building state capacity; 2.7% have a poverty reduction content; and 2.9% contain pro-environment policies. The IMF's primary reason for targeting food and agriculture is to enforce fiscal discipline by removing subsidies, yet our analysis identifies that only 8% of these policies abolish subsidies. A more consistent explanation of the IMF's interest in food and agriculture is its broader mission creep into development policy, and its deep-rooted pro-market ideology.

Keywords: International Monetary Fund; agriculture; Washington Consensus; development; content analysis; food policy.

1 Introduction

"Bread coupons will be abolished and the price of bread will be liberalized." Armenia, 28-Jun-1995, (IMF, 1995a).

"Privatize … or liquidate all state farms," Albania, 14-Jul-1993, (IMF, 1993a).

"Complete liquidation of the Bolivian Agricultural Bank…" Bolivia, 27-Jul-1988 (IMF, 1988a).

Major events such as the global 2008 food crisis exposed some of the weaknesses of the international trade system. The crisis challenged the structural capacity of the system to feed the world population. This system's strained capacity and slow adaptability supplied additional energy to the policy debate on food sovereignty and the efficiency of economic globalization of agricultural trade (Laroche Dupraz and Postolle, 2013). Yet, the literature lacks a systematic empirical foundation to evaluate the role played by powerful international financial organizations in fueling the liberalization of agricultural policies.

This article presents a comprehensive database on the International Monetary Fund's conditionality, available online as supplement files (Daoud, 2018a). Drawing on previous research (Kentikelenis et al., 2016), we isolated conditions related to food and agriculture using a combination of dictionary-based text (machine) mining and qualitative (human) content analysis (Grimmer and Stewart, 2013). We apply this methodology to a novel database that locates over 4,500 loan-related documents and identifies 58,406 conditions affecting all types of sectors of 131 countries during the period 1980-2014. Rather than assuming IMF programs deliver homogenous policy effects on agriculture, this new dataset unpacks the heterogeneity of IMF conditions across time and space. This dataset enables scholars to provide more nuanced and fine-grained analyses of IMF operations than what has been produced thus far (Fiebiger, 2014).

Another key contribution of this article is to mobilize this data to provide historical stylized facts of the IMF's operations in this sector. For future research, our work enables scholars to investigate the causes and effects of agricultural conditionality vis-à-vis other key issue areas, such as public health, poverty, food riots, food price inflation, food security, urbanization, and land grabbing (Bohstedt, 2016; Conklin et al., 2018; Daoud et al., 2017, 2016; Daoud and Reinsberg, 2018; Kentikelenis, 2017; Liao et al., 2016; Nandy et al., 2016; Nyantakyi-Frimpong and Kerr, 2017; Ponce et al., 2017). While the frontier of international political economy offers insights on the World Bank's involvement in food and agriculture(Clemens and Kremer, 2016; Ellis and Biggs, 2001; Gibbon et al., 1993), it is relatively silent on the IMF's operations (Bienen and Gersovitz, 1986; Walton and Seddon, 1994).

The article contributes to scholarship by focusing on food and agricultural policies in developmental versus night-watchman states, in a historical perspective. Governments in several developing countries tend to protect their food and agricultural sectors from global market forces (Laroche Dupraz and Postolle, 2013). These governments argue that they require protectionist strategies to provide for their populations to reduce food insecurity, and to modernize their agricultural industries (Cline, 2004; Daoud, 2017; FAO, 2003; Stiglitz, 2003; WTO, 2004). Governments possess an array of policy tools to achieve these goals: setting up state-owned farms to grow the stock of food; regulating food prices to combat inflation; establishing agricultural banks to facilitate capital investments in farming; or imposing import and export tariffs and quotas to benefit their domestic markets. These policy

tools belong to what is known as a 'developmental state' strategy (Johnson, 1982). The essence of a developmental state consists of government-led programs that seek to transform the domestic economy to produce more value-added goods and services than before. At a global level, the government attempts to upgrade its economy in the international division of labor toward more high-tech sectors (Chang, 2014; Saraswati et al., 2013; Woo-Cumings, 1999). The strategy revolves around using a state's capacity to navigate a country's development, rather than relying on the tides of markets alone. However, little is known about how effective these developmental strategies are in forming a reliable food and agricultural system—from food security to economic growth. Also, the developmental state literature has focused on middle- and low-income countries' industrialization efforts, and devoted less attention to the agricultural sector in a historical perspective. Looney (2012) notes on Korea, Taiwan and China that, "the developmental state literature…generally ignores the role of the state in rural development […and has] paid very limited attention to the rural sector" (pp. 1-2, 30-31). The present study contributes to addressing these knowledge gaps.

The counter-image to the developmental state is the 'night-watchman state' (Friedman, 1982). This state model is predicated on a libertarian political philosophy, which focuses on protecting and expanding individual economic freedoms and enforcing property rights. State intervention is justified only on the grounds of correcting market failures. The overarching goal of this philosophy is to boost market activity, and thus, eradicate poverty through economic growth. Infused by this philosophy, a set of free-market policies, known as the 'Washington Consensus', gained momentum in the 1980s (Williamson 1990). These policies include macroeconomic stabilization, privatization, liberalization, and deregulation (Summers and Pritchett 1993). Among the key advocates of the Washington Consensus are the Bretton Woods Institutions—the International Monetary Fund (IMF) and the World Bank (Babb, 2013; Babb and Kentikelenis, 2017; Henisz et al., 2005; Kentikelenis and Seabrooke, 2017; S. Nelson, 2014; Reinsberg et al., 2018; Williamson, 1990). They argue that state-led modernization programs, subsidies, and interventions are not only costly but also market distortionary, leading to inefficient allocation of resources (Summers and Pritchett, 1993).

While scholars have engaged in extensive conceptual debates about the efficacy of developmental versus night-watchman state policies, they have struggled to systematically evaluate their hypothesized causal relationships empirically. To conduct such evaluations they required transparent databases, which have thusfar been lacking. We supply such data, enabling scholars to push the research frontier forward.

The IMF, along with the World Bank, occupies a unique position in the global community because it can directly affect the policy space of developing countries (Dreher, 2009). Borne out of the Bretton Woods Conference of 1944, the IMF's mandate is tailored towards monitoring and supporting governments on macroeconomic issues. Its goal is to uphold global financial stability, which includes acting as a lender of last resort to governments in fiscal crises. Through its conditional lending programs, the IMF promoted pro-market policies (Chang, 2006; Stiglitz, 2003; Vreeland, 2003; Woods, 2006). Unlike the World Bank, the IMF's mandate does not include food and agricultural issues. Yet, in practice these sectors have not been exempt (Berazneva and Lee, 2013; Klomp, 2014; Walton and Seddon, 1994). IMF representatives claim that the organization occasionally includes food and agriculture reforms if they are critical for achieving macroeconomic stability, but that "this is rare" (Plant, 2008) because the IMF lacks competence on these issues (IMF, 2008a). We scrutinized the IMF's research units—mainly, Poverty and Inequality, Energy and Environmental Economics, Development Economics—and none of the researcher of these

units list food and agriculture as their area of expertise.[1] Two fundamental questions arise: how often has the IMF included loan conditions on food and agricultural policies, and what is the content of such policies?

Hence, this article aims to answer these two questions. First, we ask to what extent the IMF targets food and agriculture with its conditional lending programs. Extensive targeting provides evidence for what is called *mission creep,* or *organizational slippage*: spreading of organizational activities away from their original mandates (Babb and Buira, 2005; Einhorn, 2001; S. C. Nelson, 2014). Many scholars suggest that the IMF's policies have moved beyond its core mandate of macroeconomic issues and into new substantive areas—driven by global forces such as economic crises or domestic interests—which challenge governments' national sovereignty (Stiglitz, 2003, p. 45). Thus, this article examines IMF food and agriculture conditionality in terms of the breadth and depth of such policy conditions across time and space.

Second, we examine the ideological orientation of agricultural conditions in terms of night-watchman versus developmental state policies. It is well known that the IMF's policies, since the 1980s, embody the Washington Consensus agenda. However, partly motivated by critique of its operations, the IMF has sought to rebrand itself (Kentikelenis et al., 2016; Rodrik, 1997). This warrants an investigation into the evolution of the content of IMF policies (Serra and Stiglitz, 2008; Williamson, 2003). To what extent has the IMF's policies shifted towards building state capacity, transparency, and social safety nets rather than mainly promoting market-oriented policies? This quantification forms a stepping-stone to future research on the links between worldwide agricultural developments, economic globalization, and IMF conditionality (Daoud, 2007).

We structure the article as follows. In the next section, we describe our data and methodology for evaluating the policy orientation of each condition (section 2). We subsequently examine the frequency, content, history, and geography of these conditions (section 3). Then, based on this evidence, we theorize about the IMF's motivation to engage in agriculture (section 4). We conclude with a discussion on promising avenues for future research (section 5).

2   Research design

Our methodological approach has two key components. First, we used machine coding based on a dictionary method to identify IMF conditions related to food and agricultural issues. Second, we conducted a human qualitative coding of the content of these conditions. The purpose of the human coding was both to validate that the machine coding yielded plausible matches and to evaluate the policy content of each condition.

Design of the machine coding

The first part of our machine coding consisted of developing a list (dictionary) of words and phrases relating to food and agricultural issues. We compiled this dictionary based on Food and Agriculture Organization of the United Nations (FAO) terminology. We chose FAO as it is an external source—independent of the IMF or academic discourse—and is the leading global authority on food and agricultural issues.

[Figure 1 about here]

---

[1] This webpage analysis was conducted during year 2017 and 2018.

Figure 1 outlines how we constructed the dictionary, call it *D*. FAO maintains 72 datasets in its area of interest.[2] We screened these datasets, identifying those that contain concrete nouns (e.g. apples, milk, sugar), and relevant abstract nouns (e.g. agriculture prices, labor force survey, population census, agriculture employment). We identified 29 datasets that contained 1,045 value labels. Table S3 in the supplementary material section lists all these 29 sources. The value labels contained in these datasets comprise our set of candidate terms for our dictionary. We further processed these terms by removing numbers and special characters, and adding singularized and pluralized relevant terms. We manually and iteratively, by trial and error, validated the relevance of all terms against the IMF corpus. Our final dictionary distilled down to 772 unique terms, *t*. In a compact set notation, we write, $D = \{t_1, ... t_k\}$, where the index *1* through *k* indicates the number of validated FAO terms in the dictionary, *D*.

The second part of our dictionary-based method consisted of identifying an all-encompassing IMF corpus database on which to apply the dictionary. While several datasets exist on IMF programs (e.g. Vreeland, 2007), only the IMF's Monitoring of Fund Arrangements database (MONA) offers disaggregated information about the content of these programs. However, MONA has been shown to be incomplete and biased (IEO, 2007). Kentikelenis *et al.* (2016) sought to correct these shortcomings by creating a comprehensive database of IMF conditions based on relevant archival material on the IMF's lending operations. Their data are derived from 4,500 IMF documents and include 58,406 conditions across 131 countries. We thus apply the dictionary to the text of the conditions included in that dataset.

Figure 2 describes the process of how we prepared the IMF conditionality corpus (call it *C*). We used standard cleaning procedures in text mining (Jockers, 2014), by removing numbers and special characters as those do not carry qualitative meaning.[3] The corpus was then searched for cases (conditions) that contain ambiguous terminology (polysemy[4], homonymy[5], synonymy). In particular, we looked for dubious cases such as: land,[6] organic,[7] camel,[8] oil,[9] among others. We manually created exclusion and inclusion lists both for the cases (conditions) and terms (words), judged on how they matched to conditions. This procedure resulted in a document-term (in our case, conditionality-word) matrix, where each type of condition, c_p, is represented as a vector of words w_{pz}. The index *p* captures the number of conditions in the corpus, *C*, and *z* captures the number of words in each condition.

When both the dictionary and the IMF corpus were ready, we finalized the machine-driven analysis by applying our calibrated search function, *f*,

$$f(c_p) = \begin{cases} 1, & if\ w_{pz} \in D \\ 0, & if\ w_{pz} \notin D \end{cases}$$

---

[2] We accessed FAO's databases online on November, 2016.
[3] We tested lemmatizing and stemming the corpus, in contrast to keeping the corpus as it is. After validation, we decided to rely on regular expression for the text search, as that produced the most robust results (in the sense that it gave the most conservative and valid hits regarding food and agricultural issues).
[4] Polysemy is words with related meaning.
[5] Homonymy is words with the same spelling but carrying multiple meaning depending on context.
[6] *Land* does refer to both *arable land* but also *land-based border post* (for taxation).
[7] The IMF refers to "organic law" (foundational for corporations and other organizations) or "organic budget", but never to *organic* in an agricultural sense.
[8] CAMEL is a rating system developed in the U.S. banking system and used in the IMF financial language; there are no occasions where the IMF conditions policy on the animal, camel.
[9] *Oil* refers to both *edible oil* but also *oil prices*.

This function checks whether any of the words, w_{pz}, in an area of conditionality, c_p, appear in the FAO dictionary, D. If there was at least one matching word with a dictionary term, t, then that conditionality was given a value of one and filtered for further human coding. If no words matched an area of conditionality, then we declared that condition as having no direct relevance to food and agricultural issues, and thus discarded it.

Eight principles underpinning the human coding

Our human coding, conducted by two researchers, proceeded in three steps. Throughout these steps, the coders convened when they found a condition ambiguous to categorize; this happened in about 8% of the conditions. The coders also convened to verify the other category assignment to increase reliability of the coding procedure.

In the first step, we validated that the machine-driven procedure identified conditions on food and agriculture issues reliably. Even after several steps of filtering at the machine-coding phase, some conditions might still be falsely considered to be about agriculture. Table 1 outlines some conditions exemplifying our key coding principles. The first example shows a typical structure of a false positive case. The machine search identified the term *land* in 'Landsbanki'—Iceland's oldest bank—and therefore erroneously identified it as an agricultural policy. With this manual validation, we identified nine false positives.

In the second step, the two coders manually assigned a code to each condition and grouped these codes according to their substantive areas (e.g. price liberalization, privatization, capacity building). Motivated by the principles of grounded theory (Corbin and Strauss, 2007), we defined the number and content of the groups inductively and iteratively, with no prior categories. We developed eight principles to guide the qualitative analysis:

1. All machine identified food and agricultural conditions shall be human coded and evaluated.
2. The analysis ignores any non-agricultural content of food and agricultural conditions.
3. The analysis also identifies conditions explicitly exempting agriculture.
4. A condition can be split into two or more sub-conditions if it refers to different actions that the government needs to take, not otherwise.
5. Only if in doubt about the content of conditionality, then we consult the original IMF program documents.
6. Each condition, or sub-condition, is assigned to (a) only one substantive category, and (b) only one ideological category. The substantive categories are inductively generated. We posit the following ideological categories: *developmental state*, *night-watchman state*, and *model-neutral*. Inductively created refinements within these stipulated categories are allowed.
7. Conditions consistent with both models are coded *model-neutral*.
8. Both the machine and human coding aims to be reproducible, systematic, and transparent. The output of the machine and human-driven analysis consists of a qualitative (Atlas.ti bundle file) and quantitative dataset (an Excel file) (Daoud, 2018a). These data are linkable back to the original Kentikelenis et al. (2016) dataset.

Each condition was assigned a code describing its content (*principle 1*). A majority of the conditions refer to a single policy. These condidtions were therefore not split into sub-conditions (about 1,000 cases). Example 2, in Table 1, shows such a single case: the IMF requests the Kyrgyz government to terminate the moratorium on land sales. It is, however, not uncommon that an IMF condition targets both agricultural sectors and other areas. Following

principle 2, see example 3, we code only the agricultural reference in a condition and ignore the rest. Example 4 displays a single condition but with an exemption in the timber sector. The IMF tends to use these if the timing of some policy is unsuitable (e.g., domestic social disturbance). Based on *principle 3*, we set them aside in a special category called, *exempting agricultural policy*—we found 37. Motivated by *principle 4*, example 5 and 6 demonstrate how we could split a condition into two when it referred to two distinct policy actions. Example 6 highlights a split condition case where one of the sub-conditions requires an official announcement of the government's actions.

After we assigned substantive codes, we manually grouped these into super-categories (*principle 6*). For example, code 4 and code 6 in Table 1 both refer to the elimination of subsidies. We assigned these and similar codes to a super-category we created, called *eliminate or reduce subsidies*. We repeated this process until all substantive codes were assigned to a super-category with similar content.

After evaluating a condition's content (*principle 6*, again), we evaluated its ideological orientation. Based on the literature, we defined a condition as promoting a night-watchman state when it primarily promotes the extension of private property and competitive markets into different areas of food and agriculture (Summers and Pritchett, 1993; Williamson, 1990). This governance model regards the state's primary function pertaining to upholding law, security, and property rights (Gamble, 1988). We base our definition of the Washington Consensus and night-watchman state on Williamson's list of ten policies and its implication for the role of government (1990).[10] He defines the Washington Consensus by referring to what institutions in Washington—most notably, the IMF, World Bank, and US Treasury Department—mean by it. These institutions aim to focus the role of government on facilitating free markets. Accordingly, we use the term *Washington Consensus* when referring to the set of policies outlined by Williamson and employ the term *night-watchman state* when alluding specifically to the role of the state as per the Washington Consensus.

We define developmental state conditions as those that seek to use a state's capacity to intervene in the economy to modernize agricultural industries rather than relying on the power of market forces alone (Saraswati et al., 2013; Woo-Cumings, 1999). Model-neutral conditions are those that are compatible with both developmental and night-watchman state– environmental policy, anti-poverty policy, policies that strengthen state capacity, and a residual category (*principle 7*). Some conditions pertaining to building state capacity resonate with both a developmental and a night-watchman state. Strengthening the state's capacity to tax its citizens or to monitor property rights exemplify such policies. We also inductively generated several sub-categories for the model-neutral category, which allowed us to capture further nuances in IMF conditions.

We conducted the human coding in Atlas.ti 7.2. One major advantage of using computer-assisted qualitative coding software is that it makes the process systematic, transparent, and reproducible, fulfilling *principle 8*. The machine coding was conducted in R programming.

---

[10] Williamson's list of ten policies is as follows: 1. Fiscal discipline; 2. Targeted social safety nets; 3. Broad and moderate tax base; 4. Market driven interest rates; 5. Competitive exchange rates; 6. Trade liberalization: 7. Liberalization of foreign direct investment; 8. Privatization of state enterprises; 9. Deregulation of markets; 10. Protection of property rights.

3 Results: Empirical evidence of IMF Food and Agriculture Conditionality

This section evaluates the empirical evidence on the existence of IMF food and agricultural conditionality in the 1980-2014 period. The section starts by counting the frequency of such conditions, then presents their content, traces their evolution, and—lastly—shows their geographical distribution. Where relevant, we provide the references to the original IMF program documents (staff reports, letter of intents, executive board specials and minutes) that form the archival foundation of our database.

3.1 The frequency of conditionality

Of all the 58,406 IMF conditions, 1,105 (2%) conditions[11] had content matching with the FAO dictionary. These are included in 332 (43%) programs (of 781), affecting 100 countries. Table S1, in the supplementary section, lists these countries and the number of times they have been affected.

To get a sense of whether 2% is sizable or not, we conducted two benchmarking exercises. Kentikelenis *et al.* (2016) offer the first point of comparison. Based on a qualitative content analysis, they find that the IMF's largest (core) policy area, *external debt issues*, sum to 15,407 (27.8% of the total) conditions, dwarfing the share of food and agricultural conditions. Food and agricultural conditions match rather the share of typically sized policy categories: *poverty reduction policies* contain 822 conditions (1.5 % of the total), *institutional reforms* 1,357 (2.4%), *labor issues* 1,987 (3.6%), and *state-owned enterprise privatization* 3,303 (6.0%). Table S2 shows how our matches cut across their policy areas.

A specialized benchmark is to compare food and agricultural conditionality against the IMF's conditions on health systems (Stubbs et al., 2017; Stubbs and Kentikelenis, 2018). For that, we constructed another dictionary containing the terms: *health, medic, pharma, drug, nurse, doctor, disease, vaccine, immuniz, measl, dpt, polio, hospi, care spend, care law, clinic*. This dictionary matched on 215 conditions, 0.4% of the total, indicating the relative value placed on food and agriculture over health issues.

Table 2 outlines the top 50 dictionary terms based on hits. Words with the stem *agric* (agricultural, agriculture, etc.) are the most frequent of the IMF's food and agricultural conditionality, with 192 hits; followed by *land* (138 hits), and *water* (106 hits). The rest of the list indicates that IMF conditionality targets a myriad of food and agricultural areas: farming, irrigation, fishery, textile, cigarette, and alcohol products. The hits displayed in the table match on non-unique conditions, implying that different terms can match on the same condition. These machine-driven results (hits) will, nevertheless, sum up to 1,105 unique conditions in the Kentikelenis *et al.* (2016) database.

[Table 2 about here]

3.2 The content and ideological orientation of conditionality

[Table 3 about here]

The qualitative content analysis shows that IMF food and agricultural conditionality vary in breadth and depth. Table 3 outlines our 14 inductively generated policy categories and three overarching ideological models. The model-neutral category consists of four inductively

---

[11] We counted 1,228 conditions if including sub-conditions.

generated sub-categories: *environmental, build state capacity, poverty reduction,* and *miscellaneous.* The 14 policy action categories capture the substantive content of food and agricultural conditionality that the IMF and governments have agreed to include in their adjustment programs. We proceed by presenting key overarching findings, and then outline specific results on each of the 14 categories.

Of the 1,105 conditions, we further identified conditions that can be split into sub-conditions. As we explained in the methods section and exemplified in Table 1, we split a condition when it referred to more than one policy actions for which the government needs to comply. This procedure generated an additional 123 conditions, leading to a total of 1,228.

Our analysis shows that the ideological orientation of the IMF's food and agricultural conditions is more nuanced than how the IMF has been portrayed in the literature (Babb, 2013; Walton and Seddon, 1994). Our results show that 59.2% (727) of the 1,228 conditions are oriented towards a night-watchman state model; 40.1% (493) are model-neutral; and 0.7 % (8) developmental. Within the model-neutral category, 23.9% (294) are conditions oriented towards building state capacity. Only 2.7% (33) have an explicit poverty reduction content and 2.9% (35) contain a pro-environmental policy—we discuss this finding in the discussion section.

The policy action categories tend to be tilted towards one of the ideological models. The category *establish, privatize or reduce cost of SOE (State Owned Enterprise), and liberalize sectors* is the largest category (192) overall and scores the highest on the night-watchman state model (178). Ukraine (21), Tajikistan (19), and Mali (11) are the top three targeted countries of these market-oriented policies. Also being one of the highest affected countries overall, Ukraine is an interesting case. Between 1995 and 1999, following the breakdown of the Soviet Union, IMF conditions stipulated that the Ukrainian government must de-monopolize and privatize large portions of agricultural production, distribution and storage enterprises. Some of the more extensive conditions required, for example, that the government privatizes "…70 percent of shares of 9,500 medium- and large-scale enterprises and 300 grain silos…"; initiate "…bankruptcy procedures for all of the identified 170 collective farms that did not settle their debts"; or "….change the by-laws of Bread of Ukraine, eliminating its role as a government agent dealing with issues of provision of agricultural inputs and debt collection" (IMF, 1997a). In 1996, during the most intense period of mass privatization and social tension, the government founded *Khlib Ukrainy* (Bread of Ukraine) to protect a strategic chunk of Ukraine's grain marketing infrastructure (e.g. harbor facilities), against the preference of the IMF (IMF, 1997a, p. 25). In the end, however, the bread sector was de-monopolized, and parts of the Bread of Ukraine enterprise were privatized (Anderson and Swinnen, 2008, p. 204).

Two conditions aimed to improve state capacity, and twelve are miscellaneous. The two state capacity-improving conditions refer to the IMF's involvement in Niger in 1987. After periods of water scarcity in the country, agricultural production was severely affected, hitting people's livelihood (Daoud, 2018b, 2011, 2010). In this situation, the IMF, the World Bank, and the government agreed on an action plan to establish a new state-led water company (IMF, 1987a, 1986a).

The second largest category (158), *improve trade and investment conditions,* contain mostly conditions liberalizing trade (137). These measures include the usual decrees of lowering and equalizing tariffs across sectors or removing quotas in exports and imports of agricultural

products. For example, Bulgaria (11) in the 1990s was the most affected by this type of market-oriented measure. The Bulgarian government turned towards the West after the fall of the Warsaw Pact, and the IMF was called in. This program exemplifies the highly detailed manner in which the IMF can stipulate its conditions. It wanted the government to abolish temporary import zones[12] and registration requirement in "…live animals, meat, dairy products, Christmas trees, grapes, wheat, barley, maize, rice, cereal flour, sunflower seeds and oils, sugar, yeast, alcohol, brans, oil cakes, forage, tobacco, skins and hides, and wool" (IMF, 1998). This type of detailed advice is typical of many programs.

We identified five conditions that protected the domestic market from international competition, and which, therefore, qualify as developmental strategies. The IMF sought to introduce custom duties on coffee and cocoa in Armenia (IMF, 1995a); increase export tax on timber and semi-processed logs in Cameroon (IMF, 1995b); introduce surcharge on alcohol beverages and tobacco imports in Equatorial Guinea (IMF, 1988b); increase port charge on rice imports in Guinea-Bissau (IMF, 1994a); and introduce tariff and import duty on agricultural products in Lithuania (IMF, 1997b). From the background chapters of the Executive Board Specials (EBS) documents, we could read that these often occurred in especially turbulent times, when the IMF and governments recognized the temporary need for protection of domestic markets against international competition.

The third largest category (135), *improve financial information collection, study economic effect, and announce policies*, contains only model-neutral conditions. The emphasis is on building state capacity regarding collecting information to improve decision making and publically announcing policies. These measures enhance the transparency of government decisions. These types of conditions were applied to 40 countries. In Mauritania (6), for example, the IMF has shown concern about overfishing, where the fish industry accounted for about half of this country's economic activity. Besides the IMF issuing environmental protection conditions (discussed below), a set of conditions required that the government continuously communicate to IMF staff about the state of the fishing sector. These conditions could be about sending a quarterly table summarizing confiscations of juvenile fish (IMF, 1994b), making sure that access rights to cephalopod and demersal fishing are being respected, or employing specialized experts to strengthen surveillance of fish exports (IMF, 1992). Accordingly, these state-capacity enhancing policies resonate with both a developmental and night-watchman state strategy, as they could promote the spread of markets or state-led governing of domestic industries, and therefore qualify as model neutral.

Poverty reduction-oriented conditions occurred four times in this third largest group. These related to the IMF's agreement with the government in Lesotho (IMF, 2003a) and Nicaragua (IMF, 2007a), respectively, to conduct poverty and famine relief studies in agriculture.

The fourth largest category (130), *strengthen tax and financial base*, also has a clear emphasis on building state capacity. The Pakistani government (22) is the top recipient and provides a representative example. Most conditions sought to extend and improve tax collection from the agricultural sector (IMF, 1993b). In the water sector, the IMF required that the government improve its assessment and collection of water charges (IMF, 1988c). The pattern is similar in the other 38 countries affected by conditions in this policy category, but there is also an emphasis on introducing and raising excise tax on alcohol and tobacco products (see for example Turkey, (IMF, 1999a)).

---

[12] A temporary import zone is an area, e.g. a harbour, where import of goods is admited without payment of customs, with the view to subsequently re-export the goods.

Thirty-three conditions in this fourth category are about either expanding value-added tax (VAT) or removing VAT exemptions. We also assigned these to building state capacity, as they tend to expand the financial base of governments. However, it should be noted that some recognize these types of policies as promoting the night-watchman state, especially if the aim of these actions is to level out any tax exemptions that can lead to imbalances—or favoring—between different market sectors (Swank, 2006). Our definition of model-neutral captures these types of dubious cases.

The fifth to eighth largest categories resonate mostly with the night-watchman state model. Using key words such as *establish land registry, commodify land,* or *primary product* (123), they require passing new laws enabling the commodification of land and to distribute certificates of already privatized farmland. Many of the former Soviet Union countries were affected by these conditions as their governments organized collective farms. In Russia, for example, the IMF required the president to issue a decree that enables all owners of private real estate assets to acquire the land on which their property was located (IMF, 1997c). Fifteen conditions are about improving the state's capacity to maintain land registries. These policies included establishing land agencies, as in the cases of Rwanda (IMF, 2007b) and Grenada (IMF, 2008b).

The overwhelming majority of conditions in *change price regime* are geared towards liberalization. They could target the entire agricultural sector, or primary products (e.g. wheat, coffee, rice). If the government handled the domestic distribution of these goods, the IMF wanted the selling price to reflect the global market price. Some policies sought to introduce market prices, but still allowed for a gradual transition. As in the case of Tanzania, the government was authorized to keep regulated prices: "Elimination of price controls except for 'essential items'…" (IMF, 1990).

In two instances, both occurring in Moldova, the IMF wanted the state-owned water and energy company to set the prices instead of letting the market regulate them (IMF, 2007c, 2006). This measure reinforces state capacity. The reason for this was disruptions in the water markets. However, the IMF pointed out that the fees "…are currently so far below cost-recovery levels…" recommending—not stipulating—that the authorities raise water prices (IMF, 2006, p. 16).

The IMF issued some of the most drastic conditions to *eliminate or reduce subsidies* (98) in Armenia. Consider the following six sequential conditions and their potential outcome on vulnerable groups: "Increase the price of bread in three stages…" ; "The bread price will be adjusted further…" (IMF, 1994c). And, "Pass on the full cost of bread production…"; "Bread coupons will be abolished and the price of bread will be liberalized"; and "Remove cross subsidies on drinking water for households and direct subsidies on garbage removal, district heating, and hot water" (IMF, 1995a). In Egypt, the IMF took a more creative approach. Instead of reducing subsidies to bread production directly, it required the Egyptian government to reduce "…the size of the 'popular' bread loaf" (IMF, 1991).

Exactly 50 conditions in the category *change the role of marketing board* (57) seek to reduce the role of stabilization funds and marketing boards, qualifying as night-watchman state policies. These organizations are used by many developing countries as an intermediary between the domestic and world market (Woo-Cumings, 1999). Their common role, as legal cartels, is to buy primary products from farmers at a fixed price and then sell that product on

the global market. In this way, the marketing board attempts to protect farmers from volatile world prices, and potential revenues would be reinvested in domestic industries. However, marketing boards have also been criticized for exploiting farmers by buying at a fixed low price and selling their products at a systematically higher world price, funding lavish life-styles of state employees (Bates, 1981; Shivji, 1978), and also acting as a source of government corruption (Daoud, 2015; Halleröd et al., 2013; Veeman, 1982). Nevertheless, it is not surprising that these entities are targeted by the IMF, as it views them as distortionary for both domestic and global competition. The top five affected countries are all African: Ghana (related to cocoa marketing), Burundi (coffee), Malawi (tobacco), Togo (cotton), and Senegal (rice).

It is, therefore, unexpected to find that on seven occasions the IMF sought to strengthen the role of marketing boards. For example, in the Dominican Republic the IMF issued a condition to establish a joint venture between the government and Dominica Agro Industries Ltd (which previously bought a government-owned agro-processing plant) to market fresh grapefruits and other citrus fruits (IMF, 1986b, p. 42). The reason for this joint venture was depressed citrus production and export conditions. In Burundi, the IMF acknowledged that "…the Government is concerned with improving the marketing of coffee…" via its Burundi Coffee Company (IMF, 1988d, p. 10). In agreement with the IMF and the World Bank, the government managed to restore financing of 1 billion in Burundian franc (7.1 million U.S dollar in 1988 currency) to marketing coffee globally.

The eight policy action categories that we have described so far cover 81.7% of IMF food and agricultural conditionality, and are largely dominated by night-watchman state policies. The ninth to eleventh largest categories have a model-neutral substance. All conditions in *strengthen agricultural ministry* (55) build state capacity. In Cambodia (8), which is one of the most affected countries in this category, the IMF sought to establish a "…forestry crime monitoring unit…" which was required to report quarterly and publicly to the Council of Ministers (IMF, 1999b). The process of transforming the Cambodian economy from planned to market-driven had put pressure on its largest resource: forestry. This pressure came mainly from an increasing activity in illegal logging activities outside of the official concessions (IMF, 1999b, pp. 9–10). In a similar spirit, the majority of the IMF's conditions in this category seek to empower ministries by requiring new laws to be passed or new agencies established. The main purpose, exemplified by the Cambodian case, is to enhance these ministries monitoring capabilities for both collecting tax and countering economic crime (IMF, 1999b).

Support and train agricultural actors (52) target mainly farmers and small companies. We classified three as developmental. One of these was about Somalian farmers' citrus production (IMF, 1987b). The IMF and the government agreed to modernize the agricultural sector, and the citrus industry was chosen as a pilot project. That industry had been plagued by bad harvest due to drought, and now—with proper training and new technology—the parties were hoping to increase production. The IMF's new agriculture development strategy for Sao Tome and Principe is another example (IMF, 2000). The government agreed to consolidate the gains achieved in the late 1990s in fiscal and exchange rate stabilization and move towards economic diversification. Beyond strengthening tourism, it was decided to modernize the agricultural sector and to promote new exporting routes with neighboring countries (IMF, 2000, p. 21).

Still, these types of conditions are exceptions. Thirty-five conditions in the policy category have an environmental orientation, of which twenty-one targeted Mauritania's fishing sector. Motivated by a worry of overexploitation of fish, the IMF and the Mauritanian government agreed to various policies: from specific actions such as banning "…fishing nets with a mesh size under 70 millimeters"; to more general actions as establishing "…license for industrial fishing" and issuing "territorial fee for artisanal fishing" (IMF, 1993c). As these conditions are geared towards protecting a national resource rather than developing the economy towards producing higher-value-added goods, we categorize them as environmental in model-neutral instead of developmental.

Repay arrears, or recover loans from debtor (37) have no clear ideological direction, and thus we categorize nearly all as miscellaneous in model-neutral. These conditions are mainly about actors, for example, domestic companies, settling their debt to the government; or, the government paying back to creditors. The aim is to balance the government budget by settling old contracts.

The twelfth category, *establish, capitalize, privatize, liquidate or restructure agricultural banks or ministries* (33), promotes night-watchman state policies and tends to reduce state capacity. The IMF tends to target national agricultural development banks (Seibel, 2000). We find that 73% of these conditions (24) privatize, liquidate, or downsize these agriculture banks. Fourteen countries are affected: Vietnam (3), Romania (3), Tajikistan (3), Bolivia (2), Lithuania (2), to mention the top-five countries.

Interestingly, the IMF appears to have acted against this trend in four conditions and sought to strengthen or establish new agricultural state-led organizations. Haiti accounts for two of these state capacity building conditions. The IMF recognized the need for a Haitian public investment program, which focused on rural development projects in irrigation and road building. It requested, therefore, the establishment of a new state-led agricultural credit bank (IMF, 1987c). However, at a closer look, it turns out that this new bank was created as a more streamlined version of two existing organizations that were closed down by the IMF earlier: Bureau of Credit Agricole and the Banque Nationale de Developpement Agricole et Industriel (IMF, 1986c, p. 39).

The thirteenth largest category, *support poverty reduction efforts* (28), can fit both a developmental and night-watchman state agenda, which is why we assigned it as a model-neutral strategy. When issuing a poverty reduction condition, the IMF tends to do that in conjunction with a price regime change. Moldova is a typical case. The IMF set out in a condition that the Moldovan government "…increase of tariffs for heat and water…" in line with a reasonable cost-recovery level, but with "…an increase in compensation to poor households" to cushion the effect on them (IMF, 2006). These types of anti-poverty measures could also happen when the government, as in Nicaragua (IMF, 2003b), was ordered to raise the VAT but was allowed to keep some exemptions on essential goods. It should be noted, nonetheless, that in the vast majority of conditions related to liberalizing food and agricultural prices, no additional poverty reduction efforts were put in place.

The last category is about *reducing government expenditure* (20), consistent with night-watchman state policies. All these conditions sought to limit government spending in various ways, ranging from extensive measures such as laying off 4,000 workers in agricultural companies, to simpler ones such as canceling Christmas bonuses, both happened in Romania (IMF, 2003c).

Having discussed the content of IMF food and agricultural conditionality, we now turn to consider its historical trajectory.

3.3 The evolution of conditionality

[Figure 3 and Figure 4 about here]

Figure 3 shows the historical trend of the frequency of IMF food and agricultural conditionality by ideological model. In 1980, the total frequency of all these conditions was relatively small, with a sharp rise by the mid-1980s, reflecting the rapid expansion of IMF programs in general, with a peak by the end-1990s. This peak also marked the height of criticism of IMF policies. By then, the IMF sought to 'streamline' its conditionality policy (Babb and Buira, 2005), promising that conditions will be kept to a minimum (IMF, 2009, 2001). By the turn of the millennium, we find that the number of conditions dropped sharply. This decline can be explained by the end of programs of some large agricultural economies (e.g. Ukraine) or agrarian-based societies (e.g. Mauritania). Figure S1 in the supplements section shows the trends by country. The period between 2000 and 2014 entails a comparably stable number of food and agriculture conditions of about 15 per year. Additionally, the number of conditions between the first decade of IMF lending activities (1980 and 1990) is 167, and the number of conditions in the last decade (2004 and 2014) is 155. Still, during the last few years, the trend is declining, and it is possible that these conditions will eventually be phased out.

Figure 4 shows the yearly proportions of the key ideological models in IMF food and agricultural conditionality. The proportion of night-watchman state conditions peaked in 1996/97, with about 80% of the conditions having this ideological orientation. After the 2008 global financial crisis, this proportion had shrunken to less than 25%. Conditions oriented towards state capacity building have been steadily rising since the 1990s, from about 12.5% in the mid-1990s to about 50% in 2010. The graph also shows a small rise of poverty reduction conditions: hovering just above 0% in 1980, to below 5% in 2005, with a minor burst to 12% around the global financial crisis, and finally, fizzling out by the year 2014.

In the appendix, we scrutinize further the types of conditions in the food and agricultural sector. First, since IMF food and agricultural policy measures mostly require changes to the structure of the agricultural sector and the institutions that govern it, these measures are predominantly "structural conditions" (Figure S2). Second, most of the IMF food and agricultural policy conditions are binding. Binding conditions make up about half (597) of all food and agricultural conditions—see Figure S3. These conditions consist of prior actions, structural performance criteria, and quantitative performance criteria (see e.g. Copelovitch, 2010). Prior action conditions are usually issued when the IMF is in doubt on whether the country in question will implement the program consistently. These conditions make up about 36% of all food and agriculture conditions. The IMF considers these conditions crucial for the continuation of a program, and it will delay access to further finance until they are implemented.

3.4 The geography of conditionality

[Figure 5 about here]

Geographically, food and agricultural conditionality has been introduced in 100 countries of the 131 that had an arrangement with the IMF. Figure 5 maps the geographical trend, showing that a majority of the African countries—where food insecurity is largest—were affected by these conditions. The West African region had the most conditions, with—among them—Mauritania in the lead 69 conditions), followed by Senegal (41), Ghana (39), and Mali (30). These countries depend largely on agriculture, with respect to both domestic production and international trade.

Another hotspot affected by this type of conditionality is Eastern Europe, specifically countries of the former Soviet Union: Ukraine (58 conditions), Albania (37), Tajikistan (36), Kyrgyz Republic (25), Georgia (24), Moldova (24), Armenia (20), Bulgaria (20), and Azerbaijan (18). Most of these countries were the agricultural powerhouses of the Soviet Union. Ukraine, for example, was one of the main suppliers of agricultural products (Osborne and Trueblood, 2002), and today is one of the world's largest agricultural exporters. After the collapse of the Soviet Union, most of these countries—including Russia (12)—went through radical privatization programs under the supervision of the IMF (Hamm et al., 2012; King, 2001; King and Sznajder, 2006). Not surprisingly, their large-scale privatizations and liberalizations included their agricultural sectors.

Latin America has been largely spared of IMF food and agricultural conditionality. This is puzzling as this region underwent intense IMF adjustments in the 1980s and 1990s (Remmer, 2002). For example, regional powers of Latin America—Argentina, Mexico, Chile, and Brazil—have substantial agricultural industries but little or no agricultural conditions. This is an interesting contrast to Eastern Europe, which we discuss in the next section.

4   Theorizing about IMF food and agricultural conditionality

The article presented stylized facts about the IMF's interventions in food and agriculture, an area in which the IMF lacks the mandate and expertise to operate (Plant, 2008). The qualitative analysis has shown that many of these conditions envisage radical structural changes in agricultural sectors and rural social structures. In this section, partly based on our empirical material and partly on previous research, we turn to theorizing about possible causes of these interventions.

We consider three mechanisms that drive the IMF to spread its activities into food and agriculture. The first mechanism relies on the IMF's stipulated reason for why it would target agriculture: disciplining governments' fiscal budgets (IMF, 2013, 2008a; Plant, 2008). Agricultural subsidies are the main target. As the former Deputy Director of the IMF's Policy Development and Review Department, Mark Plant articulates the point:

> "In general, the IMF does not provide policy advice on agriculture, or any productive sector (that's the preserve of the World Bank and other donors). However, sometimes in a Fund-supported program, country authorities will include sector-specific reforms, including in agriculture, if it is critical for macroeconomic stability. For example, when subsidies to the agriculture sector are straining the government's budget. But this is rare. Over the past five years, just 35 out of 2,640 lending conditions in Fund-supported programs related to agriculture." (Plant, 2008)

Indeed, subsidies can be expensive for governments to maintain (Lensink, 1996). Still, policymakers see them as a vital policy tool. One of the strongest reasons for implementing

15

them, besides combating poverty, is maintaining national self-sufficiency in agriculture—a crucial asset in times of war. For example, in Pakistan, subsidies on food, fuel, and electricity accounted for 2.5% of GDP in 2008 (IMF, 2008c); irrigation subsidies in India were somewhere in the vicinity of US$579 million per year from 2004 to 2008 (Palanisami et al., 2011); the European Union subsidizes agricultural production by €59 billion per year, partly driven by its Second World War experience; similarly, the United States has long been subsidizing farming, which has produced a massive yearly cereal surplus that has been used, among other things, for foreign food aid (Nunn and Qian, 2014; Prasad, 2012). As these costs can occupy a considerable portion of a government's expenses, the IMF will target these subsidies—as we, for example, observed in Pakistan.

Nonetheless, this cannot be the only explanation, given that only 8% of the food and agricultural conditions targeted subsidies. Subsidies rank only seventh in the list of the above-identified policy categories. Even if we included two additional policy categories that usually are important for macroeconomic stability in favor of this explanation, we would be left with a significant portion of unaccounted conditionality. *Reduce government expenditure* category adds 1.6%, and *strengthen tax and financial base* gives another 11%, which altogether, with the category *removing subsidies*, would only account for 20% of all the conditions. Accordingly, there has to be other, stronger driving forces motivating the IMF's interest in agriculture beyond fiscal discipline.

A second possible reason as to why the IMF scrutinizes food and agricultural sectors follows from its mission creep into the development scene (Babb and Buira, 2005). As past studies have shown (Dreher, 2009; Vreeland, 2003), after the dissolution of the Bretton Woods system, the IMF struggled to redefine its role and identity and gradually became a development-oriented organization (Vetterlein and Moschella, 2014). As many of the low- and middle-income countries that turn to the IMF are agrarian economies, the IMF will necessarily face issues in food and agricultural sectors (Walton and Seddon, 1994). For example, Ukraine, the second highest global recipient of such conditions, was one of the agricultural power-houses of the former Soviet Union; the other top recipients, Senegal, Ghana, Albania, and Pakistan, all have large agricultural economies, with a significant portion of the population living in rural areas. Encounters with these types of countries increase the IMF's likelihood to engage in food and agriculture conditionality (World Bank, 1981).

However, the IMF's treatment of major agricultural economies does not consistently explain its interest in food and agriculture—as we noted in Latin America. Our findings show that major economies with both sizable agricultural industries and extensive IMF programs had no, or only a few, agricultural conditions. Take, for instance, Argentina, which had 265 general IMF conditions but zero in agriculture. Chile had 68 versus 0; Brazil had 185 versus 1; and Mexico had 105 versus 0. It is difficult to determine the exact causes of these patterns without conducting an in-depth study of how these countries are different from others that received food and agricultural conditionality. Nonetheless, a likely explanation is that in the early 1980s, the IMF focused on pure macroeconomic aspects—such as controlling inflation, balance of payments, and external debt—avoiding real industries and agricultural production. Stiglitz emphasizes this historical difference between the early and recent IMF programs: "If land reform … regulations were underemphasized by the IMF and the Washington Consensus, in many places inflation was overemphasized" (Stiglitz, 2003, p. 81). Subsequently, when the IMF grew in confidence by deeming its Latin American programs as successful, backed implicitly by economists like Milton Friedman hailing the Chilean case as an "economic miracle", it started to apply its policies outside of traditional macroeconomics

(Ostry et al., 2016). Thus, the IMF's night-watchman doctrine expanded to other sectors, including food and agriculture (Walton and Seddon, 1994). This observation matches with the rise of these types of conditions between the mid-1980s and the early 2000s, as outlined in Figure 3.

Accordingly, we argue that the third mechanism is rooted in the IMF's Washington Consensus values. Our empirical finding in Figure 4 shows that during the period 1985 and 2000, the proportion of night-watchman state conditions was about 75%. The IMF considered more *laissez-faire*, or less government intervention in the economy—regardless of sector—better for creating economic prosperity. The IMF's free market orientation is well-established in the literature (Chorev and Babb, 2009; De Vogli, 2011; Mueller, 2011; Rowden, 2009; Schrecker and Bambra, 2015). We find that its overall activities partly resonate with its operations in agriculture as well (IMF, 2008d). It also resonates with the Berg report, outlining the World Bank's long-term policy for growth in Sub-Saharan Africa. Berg argued that African governments have to take structural measures in addressing agriculture:

> "Agricultural output is the single most important determinant of overall economic growth and its sluggish record of recent years is the principal factor underlying the poor economic performance of the countries of this region. For this reason, growth-oriented policies for this sector are crucial." (World Bank, 1981, p. 45)

Berg's suggestions for African agriculture match with Williamson's (1990) list of ten Washington Consensus policies. In turn, matching this list with our inductively identified policy categories in Table 3, we discover a reasonable fit. At least five of his ten policy categories can be mapped onto our inductively produced categories. The removal of subsidies accounts for 8% of all IMF food and agricultural conditions. Add Williamson's trade liberalization (which maps to our *improve trade and investment conditions*), his tax reforms (our *strengthen tax and financial base*), secure property rights (our *establish land registry and commodify land*), privatization (our *establish and privatize SEO*) and we account for at least 60% of our findings. Hence, Berg and Williamson's prescriptions translate into forming a night-watchman state that is expected to boost economic performance in agriculture.

One puzzle remains. How can the IMF both favor night-watchman policies and still articulate a considerable set of policies that do not necessarily promote free markets? This is manifested in our findings in two ways. First, as only 59% of agricultural conditionality promotes night-watchman state policies, about 40% are model neutral and 1% developmental. Second, the IMF's proportion of night-watchman state conditions has been declining ever since the end of the 1990s from a peak of 80% to a trough of 25% in 2014 (see Figure 4). These patterns, we argue, reflect the IMF's movement toward an *augmented* Washington Consensus: a set of policies that includes the original set—from liberalization to privatization—but that now also emphasizes the requirement to establish favorable institutional foundations (Rodrik, 2001). After the extensive critique of the IMF's operations in Latin America and disappointing results in the former Soviet Union, the IMF sought to refashion itself. To create and optimize the institutional underpinnings of market economies, it began to argue that policymakers have to invest in mechanisms promoting corporate governance, anti-corruption, and targeted poverty reduction. Institutions would have to be installed before mass privatization programs are launched, or at least in conjunction with them. Our findings echo the re-orientation of conditionality since the mid-1990s. The proportion of state capacity-building conditions has been rising since the mid-1990s. Additionally, as shown in Table 3, improving financial information collection and announcing policies is the third largest policy category of food and

agricultural conditionality. Hence, our findings are consistent with the IMF's attempt to adapt its policies according to an augmented Washington Consensus.

In summary, the IMF's explanation of why it targets food and agriculture—namely, fiscal discipline—can only account for one fifth of our findings at most. The two stronger explanations are IMF's mission creep into the developmental business and augmented Washington Consensus values. While the IMF's Washington Consensus orientation is documented (Babb, 2013; Babb and Kentikelenis, 2017; Henisz et al., 2005; Kentikelenis and Seabrooke, 2017; S. Nelson, 2014; Williamson, 1990), the IMF's intentions behind this mission creep into food and agriculture are open to debate. As March and Olsen note, "organization implies intention…" (March and Olsen, 1985, p. 314). Nevertheless, in a complex global environment, scholars have found only a weak connection between organizations' articulated intentions and their outcomes (Babb, 2003). For the IMF, this slippage into agriculture does not necessarily signal an intentional shift in or augmentation of policies (Babb and Buira, 2005). Changing global conditions, with a mixture of shocks from economic crises and re-prioritization of the global community's macroeconomic goals, in the 1970s and 1980s altered IMF's policy objectives (Polak, 1991). The original mandate of the IMF was to monitor the global financial system under the Bretton Woods system of stable exchange rates by aiding countries in avoiding large external imbalances and facilitating adjustment to their exchange rates. After the breakdown of the Bretton Woods system, the IMF adapted its adjustment policies to facilitate economic growth. This growth-oriented approach has enabled the IMF to widen its mandate to encompass any sector that it deems macro-critical—fueling organization slippage. Consequently, with such loosened mandate and because many of the developing countries have large agrarian sectors, IMF food and agricultural conditionality emerged. This slippage due to global conditions might be unintended, yet its effects food and agricultural sectors are real. The next step in this research program is to evaluate these policy effects.

5   Discussion

This article provides a comprehensive database on *IMF Food and Agricultural Conditionality*, facilitating agricultural policy evaluations. The article provides two versions of this database, one for qualitative analysis (Atlas.ti file of the actual text) and the other for quantitative (excel sheet of agricultural policy counts). The supplementary material section provides instructions for replication of this data and discloses accessible re-coding (Daoud, 2018a). Based on this data, the article outlines stylized facts about the IMF's policy interventions in food and agricultural issues. Drawing on a combination of machine and human-driven content analyses, our analysis shows that the IMF's claim that its policies "… only occasionally target food and agriculture…" (Plant, 2008) does not match with practice. In summary, these conditions were applied in 332 (43%) of all (781) IMF programs and affected 100 countries of the 131 that have ever had an IMF program between 1980 and 2014. Our qualitative analysis shows that food and agricultural conditionality cuts through all kinds of policy areas. It encompasses privatization of state-owned farms, liberalization of agricultural trade, and deregulation of agricultural sectors. Our evaluation of the ideological orientation of these policies shows that 59.2% of the conditions promote a night-watchman state; 0.7% are developmental; and 40.1% are model neutral, capable of promoting both models. Of the model neutral, 23.9% conditions aim at building state capacity; 2.7% seek to combat poverty; and 2.9% protect the environment. This evidence qualifies as mission creep: an expansion of the IMF's activities into new policy areas. The IMF's intention to target the agricultural sector springs from

changing global conditions with the fall of the Bretton Woods and its goal to promote economic growth.

We highlight three limitations of our study before discussing some policy implications. First, our study was restricted to analyzing the discrepancy between the IMF's mission statement and its policy practice through conditionality. What other channels of influence has the IMF used to reform agricultural sectors? Two potential channels we have not analyzed comprise the IMF's surveillance and technical assistance operations. And what role the negotiating government have in requesting agricultural conditions? Governments can use the IMF as a scapegoat to implement unpopular domestic policies (Vreeland, 2007). Additionally, from our study, we know that the IMF explicitly avoided targeting food and agricultural policies in 37 conditions, but we still know little about the implementation process of the remaining conditions. How closely did the implementation follow the original agreements? How many were aborted, and for what reasons?

Second, our analysis has not quantified the relative importance of each condition, beyond organizing them in policy categories. Some conditions bring less intrusive policies compared to others: for instance, a condition about announcing a policy is fundamentally different from actually privatizing agricultural production. The former makes policies more transparent and may aid in combating corruption; the latter changes the fundamental structure of the economy. Even within the same policy area, care has to be taken about weighing the magnitude of impact. For example, a condition stipulating that a particular state-owned agricultural company has to be privatized carries a different weight compared to a condition privatizing 4,000 farms. One needs to consider, among other things, the size of these companies, production capacity, and their market structure (e.g. monopolistic or not).

Third, one possible objection to the account presented in this article is that the IMF works closely together with its sibling institution, the World Bank (IMF, 2016). Therefore, although the IMF lacks the expertise to engage in agricultural business, it will rely on the skills of the Bank to avoid missteps. This could be the case. However, although the Bank is occasionally mentioned in the IMF program documents, we find only 24 conditions that directly involve the Bank. This indicates a meager amount of formal coordination. Moreover, in the case of Tajikistan, which was a pilot case for an *enhanced Bank-Fund collaboration* in 1998, the IMF's Independent Evaluation Office (IEO) finds a well-functioning collaboration between the two organizations, but that it could be improved: "In general, staff have tried—not always successfully—to coordinate their work programs." (IEO and IEG, 2004, p. 47). Even if we assume that the IMF indirectly consults with the World Bank on each of the food and agricultural conditions it has issued in the 332 programs, the question of the IMF's mandate remains because arguably its primary role is not to reform food and agricultural sectors. Thus, even if we accept that the IMF intervenes in food and agriculture since these sectors are macroeconomically critical, and that it collaborates with the Bank to complement its lack of expertise in these sectors, our article still supplies a siginfcant contribution to the state-of-the art by explicating the nature and frequency of IMF's food and agricultural conditionality. Neither the IMF nor any other scholars have done so before.

Our findings advance food policy research in several ways. First, our article calls for further investigation of the IMF's interventions in food and agriculture and beyond. We note that our analysis shows that IMF conditionality in agriculture exhibits a more nuanced ideological orientation compared to what the literature finds when evaluating its programs. The study of Kentikelenis *et al.* (2016) is an exception, which also focuses on conditionality. Although

their analysis does not use the same quantifying methodology and focuses on social protection and labor issues, there are some interesting tangent points. They find that much of the policy advice that the IMF gives countries today is still the same advice it gave them during the 1990s—despite what the IMF management is publicizing. Our study shows that 80% of the food and agricultural conditions reflected Washington Consensus ideology in 1996/97. However, contrary to the Kentikelenis *et al.* account, we find a decreasing trend ever since, shrinking to just below 25% after the 2008 financial crisis. One explanation for this difference could be that the IMF discriminates between types of markets, treating food and agriculture differently. Another explanation, more plausible, could be that the IMF has already successfully pursued expansive liberalization of food and agriculture across the world, and therefore the application of conditionality is no longer necessary. Future research could reveal the most likely drivers.

We considered three key forces driving the IMF to target food and agricultural sectors: fiscal discipline, Washington Consensus ideology (and its augmented version), and mission creep. We have not evaluated the developmental or social impact of these policies, nor provided a causal analysis of their determinants. With the accompanying replicable dataset—provided as a supplementary file—future research can explore these matters in greater depth. Our aspiration is to fuel research about the relationship between IMF policies and agricultural issues (e.g. urbanization, land grabbing, development, poverty reduction). The data set contains disaggregated measures of conditions with their content and ideological orientation; it isolates IMF food and agricultural conditionality from other types of IMF conditionality (Kentikelenis et al., 2016); it has a global span, which enables comparative research; and it covers 25 years, thus allowing for time-series analyses.

Motivated by our findings and the IMF's acknowledgment of its lack of expertise in agriculture, it is reasonable to suggest that the IMF either should not issue any food or agricultural policies until its mandate explicitly admits such interventions, and that it builds functional competence to do so; or, the IMF should pass all agricultural conditions through a joint approval system with the World Bank, FAO, and the World Food Program (WFP). The last option resonates with the 17th Sustainable Development Goal: to revitalize the global partnership among governments and international organizations. If the circumstances demand that the IMF has to engage in food and agricultural business, then it would perhaps benefit from a deeper collaboration with FAO and WFP, beyond its partnership with the Bank. This type of close cooperation has occurred historically (e.g., the IMF's Food Financing Facility), and certainly could again. Even if it did not live up to the expectations of the global community (Kirkpatrick, 1985), it shows that collaboration is a real possibility.

Labor issues (public and private sector)	7

Notes: These policy categories follow the definitions provided in (Kentikelenis et al., 2016).

FAO databases used in the construction of the dictionary

Table S3: Food and Agriculture database sources

	Definition	Source (accessed, November 2016)

FAO - Production		
Crops	Crop statistics are recorded for 173 products, covering the following categories: Crops Primary, Fibre Crops Primary, Cereals, Coarse Grain, Citrus Fruit, Fruit, Jute & Jute-like Fibres, Oilcakes Equivalent, Oil crops Primary, Pulses, Roots and Tubers, Treenuts and Vegetables and Melons	http://faostat.fao.org/beta/en/#data/QC
Crops processed	The dataset covers the following commodities: Beer of barley; Cotton lint; Cottonseed; Margarine, short; Molasses; Oil, coconut (copra); Oil, cottonseed; Oil, groundnut; Oil, linseed; Oil, maize; Oil, olive, virgin; Oil, palm; Oil, palm kernel; Oil, rapeseed; Oil, safflower; Oil, sesame; Oil, soybean; Oil, sunflower; Palm kernels; Sugar Raw Centrifugal; Wine.	http://faostat.fao.org/beta/en/#data/QD
Livestock Primary	The dataset contains the following commodities and commodity aggregates thereof : Animals live n.e.s.; Asses; Beehives; Buffaloes; Camelids, other; Camels; Cattle; Chickens; Ducks; Geese and guinea fowls; Goats; Horses; Mules; Pigeons, other birds; Pigs; Rabbits and hares;	http://faostat.fao.org/beta/en/#data/QA

	Rodents, other; Sheep; Turkeys	
Livestock Processed	NA [FAO give no metadata]	http://faostat.fao.org/beta/en/#data/QP
Production Indices	The dataset includes data on gross and net production indices for various food and agriculture aggregates expressed in both totals and per capita.	http://faostat.fao.org/beta/en/#data/QI
Value of Agricultural Production	The data set includes data on gross and net production values, in constant international USD, and gross production values, in constant and current USD and Local Currency Units, for various food and agriculture commodities and aggregates thereof, expressed in both total value and value per capita.	http://faostat.fao.org/beta/en/#data/QV
FAO - Inputs		
Fertilizers	The dataset contains data on Production, Trade, Non fertilizer Use and Consumption for the 3 main fertilizer categories (Nitrogen, Phosphate and Potash) in terms of nutrients from 2002 onwards. Data are expressed ion metric tons of nutrients. Country and country aggregate data are available.	http://faostat.fao.org/beta/en/#data/RF

Fertilizers archive	The dataset contains data on Production, Trade and Consumption for single fertilizers, Nitrogen, Phosphate and Potash totals, Fertilizer Totals) in terms of nutrients from 1961 to 2002. Data are expressed ion metric tons of nutrients. Country and country aggregate data are available. It also contains data on Prices paid by farmers expressed in local currencies (as a consequence no country aggregates are available) for single fertilizer products.	http://faostat.fao.org/beta/en/#data/RA
Fertilizers - Trade Value	The dataset contains data on Import and Export Value (expressed in 1000US$) for a selected list of fertilizers, see below, from 1961onwards. Country and country aggregate data are available. The fertilizers covered are: Nitrogenous fertilizers; Phosphate fertilizers; Potash fertilizers; Fertilizers Manufactured, nes; Fertilizers, Organic; Natural Phosphates; Natural Potassic Salts; Natural Sodium Nitrate	http://faostat.fao.org/beta/en/#data/RV
Pesticides (use)	The pesticides use database refers to the use of major pesticide groups	http://faostat.fao.org/beta/en/#data/RP

	(Insecticides, Herbicides, Fungicides, Plant growth regulators and Rodenticides) and relevant chemical families when available. Data refers to quantities of pesticides used in or sold to the agricultural sector for crops and seeds and are expressed in tonnes of active ingredients. However, due to some country reporting practices, the data may be reported by: use or imports in formulated product; sales; distribution or imports for use in the agricultural sector in active ingredients. In these cases it is specified in the country notes. Information on quantities applied to single crops is not available.	
Pesticides (trade)	The pesticides trade database reports on values expressed in 1000 US$ of import and export for a range of products as defined by the Harmonised Coding System (HS2012) code 3808. It covers total pesticides and relevant break-down: insecticides, fungicides, herbicides, disinfectants as well as anti-sprouting products and plant-growth regulators. Starting in the year	http://faostat.fao.org/beta/en/#data/RT

2007 it has been introduced a new variable to cover the trade of certain hazardous pesticides that are subject to the Rotterdam Convention on the Prior Informed Consent (PIC) procedure. This variable, "Hazardous pesticides", relates to the HS code 3808.50 and covers mixtures preparations containing the substance subject to PIC procedure. The pesticides trade dataset also includes the pure substances that are subject to the PIC procedure; these are reported starting in the year 2007 for import/export quantity (NetWeight (kg)) and value (1000 US$). Rotterdam Convention on the Prior Informed Consent (PIC) procedure for certain hazardous chemicals and pesticides in International Trade: The Convention was initiated by FAO and UNEP in 1989 and entered into force on 24 February 2004. The Convention establishes a legally binding obligation to enable countries to decide which potentially hazardous chemicals they want to import /export and to exclude

	those they cannot manage safely. Please see the correspondence table of the pure substances in Pesticides (trade) http://faostat3.fao.org/faostat-gateway/go/to/download/RT/*/E). In 2011, import value relating to the aggregated variable "Pesticides" is available for 202 countries and the relevant regional, continental and world totals according to country classification of United Nations M-49 list. On the other hand, regional, continental and world totals are not calculated for the remaining variables due to incomplete country coverage.	
Land	Data on agricultural land-use are valuable for conducting studies on a various perspectives concerning agricultural production, food security and for deriving cropping intensity among others uses. Indicators derived from the land-use categories can also elucidate the environmental sustainability of countries' agricultural practices. FAOSTAT Land-use statistics contain a wide range of information on variables that are	http://faostat.fao.org/beta/en/#data/RL

| | significant for: understanding the structure of a country's agricultural sector; making economic plans and policies for food security; deriving environmental indicators, including those related to investment in agriculture and data on gross crop area and net crop area which are useful for policy formulation and monitoring. Land-use Inputs sub-domain covers: Country area (including area under inland water bodies), Land area (excluding area under inland water bodies), Agricultural area, Arable land and Permanent crops, Arable land, Permanent crops, Permanent meadows and pastures, Forest area, Inland water, Other land and Area equipped for irrigation. Data are available from 1961 onwards for more than 200 countries and areas. Detailed data for sub-categories are also available (starting year 2001): Temporary crops, Temporary meadows and pastures, Fallow land (temporary: less than 5 years), Permanent meadows and pastures cultivated and naturally | |

	growing as well as Organic land (starting year 2004)and Area of arable land and permanent crops under protective cover (starting year 2007). Global Forest Resource Assessment 2010 (FRA 2010) is the main source of forest area data in FAOSTAT. Data were provided by countries for years 1990, 2000, 2005 and 2010. Data for intermediate years were estimated for FAO using linear interpolation and tabulation.	
Employment Indicators	Excluded (too broad)	Excluded (too broad), http://faostat.fao.org/beta/en/#data/GN
FAO – Agriculture emissions		
Enteric Fermentation	Greenhouse gas (GHG) emissions from enteric fermentation consist of methane gas produced in digestive systems of ruminants and to a lesser extent of non-ruminants. The FAOSTAT emissions database is computed following Tier 1 IPCC 2006 Guidelines for National GHG	http://faostat.fao.org/beta/en/#data/GE

	Inventories vol. 4, ch. 10 and 11 (http://www.ipcc-nggip.iges.or.jp/public/2006gl/vol4.html). GHG emissions are provided by country, regions and special groups, with global coverage, relative to the period 1961-present (with annual updates) and with projections for 2030 and 2050, expressed both as Gg CH4 and Gg CO2eq, by livestock species (asses, buffaloes, camels, cattle (dairy and non-dairy), goats, horses, llamas, mules, sheep, swine (breeding and market)) and by species aggregates (all animals, camels and llamas, cattle, mules and asses, sheep and goats, swine). Implied emission factor for CH4 and activity data are also provided.	
Crop Residues	Greenhouse gas (GHG) emissions from crop residues consist of direct and indirect nitrous oxide (N2O) emissions from nitrogen (N) in crop residues and forage/pasture renewal left on agricultural fields by farmers. Specifically, N2O is produced by microbial processes of nitrification and	

	de-nitrification taking place on the deposition site (direct emissions), and after volatilization/re-deposition and leaching processes (indirect emissions). The FAOSTAT emissions database is computed following Tier 1 IPCC 2006 Guidelines for National GHG Inventories, Vol. 4, Ch. 2 and 11. (http://www.ipcc-nggip.iges.or.jp/public/2006gl/vol4.html). GHG emissions are provided as direct, indirect and total by country, regions and special groups, with global coverage, relative to the period 1961-present (with annual updates) and with projections for 2030 and 2050, expressed as Gg N2O and Gg CO2eq, by crop and N content in residues.	
Energy use	Excluded (too broad)	Excluded (too broad), http://faostat.fao.org/beta/en/#data/GN
FAO – Trade		
Crops and livestock products	The detailed food and agriculture trade data collected, processed and disseminated by FAO according to the standard International Merchandise	http://faostat.fao.org/beta/en/#data/TP

	Trade Statistics Methodology, is mainly provided by the national authorities and other international organizations. The trade database includes the following variables: export quantity, export value and export unit value, import quantity, import value and import unit value. The trade database includes all food and agriculture products imported/exported annually by all the countries in the world.	
Live animals	The detailed food and agriculture trade data collected, processed and disseminated by FAO according to the standard International Merchandise Trade Statistics Methodology, is mainly provided by the national authorities and other international organizations. The trade database includes the following variables: export quantity, export value and export unit value, import quantity, import value and import unit value. The trade database includes all food and agriculture products imported/exported annually by all the	http://faostat.fao.org/beta/en/#data/TA

	countries in the world.	
Detailed trade matrix	The detailed food and agriculture trade data collected, processed and disseminated by FAO according to the standard International Merchandise Trade Statistics Methodology, is mainly provided by the national authorities and other international organizations. The trade database includes the following variables: export quantity, export value and export unit value, import quantity, import value and import unit value. The trade database includes all food and agriculture products imported/exported annually by all the countries in the world	http://faostat.fao.org/beta/en/#data/TM
FAO – Food Balance		
Food Balance Sheets	Food Balance Sheet presents a comprehensive picture of the pattern of a country's food supply during a specified reference period. The food balance sheet shows for each food item - i.e. each primary commodity and a number of processed commodities potentially available for human	http://faostat.fao.org/beta/en/#data/FBS

	consumption - the sources of supply and its utilization. The total quantity of foodstuffs produced in a country added to the total quantity imported and adjusted to any change in stocks that may have occurred since the beginning of the reference period gives the supply available during that period. On the utilization side a distinction is made between the quantities exported, fed to livestock, used for seed, put to manufacture for food use and non-food uses, losses during storage and transportation, and food supplies available for human consumption. The per caput supply of each such food item available for human consumption is then obtained by dividing the respective quantity by the related data on the population actually partaking of it. Data on per caput food supplies are expressed in terms of quantity and - by applying appropriate food composition factors for all primary and processed products - also in terms of caloric value and protein and fat content.	
Commodity Balances -	Commodity balances show balances of	http://faostat.fao.org/beta/en/

Crops Primary Equivalent	food and agricultural commodities in a standardized form. The scope of standardization is to present these data in a less detailed form for a selected number of commodities without causing any significant loss of the basic variables monitoring the agricultural sector. The selected commodities include the equivalents of their derived products falling in the same commodity group, but exclude the equivalents of by-products and derived commodities, which through processing, change their nature and become part of different commodity groups. A number of commodity/item aggregates have been included to offer synthetic information. Some of these are included with the aim of simplifying the extraction of all component commodities. Data shown in the item aggregates represent the sum of the component commodities as presented in this domain (standardized form). Commodity coverage: The commodity list in this domain has been generally confined to primary	#data/BC
Crops Primary Equivalent		#data/BC

	commodities - except for sugar, oils and fats and beverages. Whenever possible trade in processed commodities is expressed in the originating primary commodity equivalent. Rice is expressed in milled equivalent.	
Commodity Balances - Livestock and Fish Primary Equivalent	Food supply data is some of the most important data in FAOSTAT. In fact, this data is for the basis for estimation of global and national undernourishment assessment, when it is combined with parameters and other data sets. This data has been the foundation of food balance sheets ever since they were first constructed. The data is accessed by both business and governments for economic analysis and policy setting, as well as being used by the academic community	http://faostat.fao.org/beta/en/#data/BL
Food Supply - Crops Primary Equivalent	Food supply data is some of the most important data in FAOSTAT. In fact, this data is for the basis for estimation of global and national undernourishment assessment, when it is combined with parameters and other data sets. This data has been the	http://faostat.fao.org/beta/en/#data/CC

	foundation of food balance sheets ever since they were first constructed. The data is accessed by both business and governments for economic analysis and policy setting, as well as being used by the academic community.	
Food Supply - Livestock and Fish Primary Equivalent	Food supply data is some of the most important data in FAOSTAT. In fact, this data is for the basis for estimation of global and national undernourishment assessment, when it is combined with parameters and other data sets. This data has been the foundation of food balance sheets ever since they were first constructed. The data is accessed by both business and governments for economic analysis and policy setting, as well as being used by the academic community	http://faostat.fao.org/beta/en/#data/CL

FAO – Land Use Emissions		
Land Use Total	Land Use Total contains all GHG emissions and removals produced in	http://faostat.fao.org/beta/en/#data/GL

the different Land Use sub-domains, representing the three IPCC Land Use categories: cropland, forest land, and grassland, collectively called emissions/removals from the Forestry and Other Land Use (FOLU) sector. FOLU emissions consist of CO2 (carbon dioxide), CH4 (methane) and N2O (nitrous oxide) associated with land management activities. CO2 emissions/removals are derived from estimated net carbon stock changes in above and below-ground biomass pools of forest land, including forest land converted to other land uses. CH4 and N2O, and additional CO2 emissions are estimated for fires and drainage of organic soils. The FAOSTAT emissions database is computed following Tier 1 IPCC 2006 Guidelines for National GHG Inventories (http://www.ipcc-nggip.iges.or.jp/public/2006gl/index.html). GHG emissions are provided as by country, regions and special groups, with global coverage, relative to the period 1990-present (with annual

	updates), expressed as Gg CO2eq from CH4 and N2O, net emissions/removals as GG CO2 and Gg CO2eq, by underlying land use emission sub-domain and by aggregate (land use total).	
FAO- Forestry		
Forestry Production and Trade	The database contains data on the production and trade in roundwood and primary wood and paper products for all countries and territories in the world. The main types of primary forest products included in are: roundwood, sawnwood, wood-based panels, pulp, and paper and paperboard. These products are detailed further. The definitions are available. The database contains details of the following topics: - Roundwood removals (production) by type of wood and assortment - Production and trade in roundwood, woodfuel and other basic products - Industrial roundwood by assortment and species - Sawnwood, panels and other primary products - Pulp and	http://faostat.fao.org/beta/en/#data/FO

	paper & paperboard. More detailed information on wood products, including definitions, can be found at http://www.fao.org/forestry/statistics/80572/en/	
FAO – Prices		
Producer Prices - Annual	This sub-domain contains data on Agriculture Producer Prices. These are prices received by farmers for primary crops, live animals and livestock primary products as collected at the point of initial sale (prices paid at the farm-gate). Annual data are provided from 1991 for over 160 countries and about 200 commodities.	http://faostat.fao.org/beta/en/#data/PP
Producer Prices - Monthly	This sub-domain contains data on Agriculture Producer Prices (APP). These are prices received by farmers for primary crops, live animals and livestock primary products as collected at the point of initial sale (prices paid at the farm-gate). Monthly data are provided from January 2010 to December of the previous year for over 60 countries and about 200 commodities.	http://faostat.fao.org/beta/en/#data/PP

Producer Prices - Archive	This sub-domain contains data on Agriculture Producer Prices and Producer Price Indices collected no later than 1996. These are prices received by farmers for primary crops, live animals weight and livestock primary products as collected at the point of initial sale (prices paid at the farm-gate). Data are provided for over 97 countries and for some 200 commodities.	http://faostat.fao.org/beta/en/ #data/PA

The FAO dictionary

The FAO dictionary we constructed contains the following 772 terms:

"abaca, acidified milk, agave fibres, agric, agricultural area, agricultural machinery, agricultural tractors, alcohol, alcoholic, alcoholic beverages, aldrin, alfalfa meal, alliaceous vegetables, almonds, almonds shelled, amalgams, amides, ammonia, ammonium nitrate, ammonium nitrate solutions, ammonium phosphat, ammonium phosphate, ammonium sulphate, ammonium sulphatenitrate, anhydrous, animal, animal fats, animal products, animal vegetable oil, animals, animals live, anise, anticoagulants, apples, apricots, aquatic animals, aquatic mammals, aquatic plants, aquatic products, arabl, arable land, area equipped for irrigation, areca nuts, artichokes, asparagus, aubergines, avocados, bacon, badian, balers, bambara beans, banana, bananas, barley, basic slag, bastfibres, beans, beef, beehives, beer, beer of barley, beer of sorghum, beeswax, beet pulp, benzimidazoles, berries, berries nes, beverage, beverages, binapacryl, bipiridils, bird, birds, bleached sulphate pulp, bleached

sulphite pulp, blueberries, body oil, boiled, boneless, bovine, bovine meat, brans, brassicas, brazil nuts, bread, breakfast, breeding, broad beans, broccoli, buckwheat, buffalo, buffalo milk, buffaloes, bulgur, burning biomass, butter, butter of karite nuts, buttermilk, butteroil of cow milk, cabbages, caff, cake, calcium ammonium nitrate, calcium cyanamide, calcium nitrate, calve, camel milk, camelids, canary seed, cane tops, canned, canned meat, captafol, carbamates, carbamates herbicides, carbamates insecticides, cardamoms, carded, carobs, carrots, case materials, cashew nuts, cashewapple, cassava, cassava dried, castor beans, castor oil seed, cattle, cauliflowers, cephalopod, cephalopods, cereal, cereal preparations, cereals, cheese, cheese of goat mlk, chemical wood pulp, cheroots, cherries, chestnut, chestnuts, chick peas, chicken, chickens, chicory, chicory roots, chillies, chips, chlordane, chlordimeform, chlorinated hydrocarbons, chlorobenzilate, chocolate products, cider, cigarette, cigarettes, cigars, cinnamon, citronella, citrus, citrus fruit, clementines, clover, cloves, coarse, coated papers, cocoa, cocoa beans, coconut, coconut oil, coconuts, cocoons, cocoyam, coffee, combed, combine harvesters, complex fert, complex fertilizer, concent superphosphate, concentrated or not, cooked, cooking, cooking oil, copra, copra cake, coriander, corn, cotton, cotton lint, cotton linter, cotton waste, cottonseed, cottonseed cake, cottonseed oil, country area, cow milk, cow peas, cranberries, cream, cream fresh, crop, cropland, crops, crude materials, crustaceans, cucumbers, curd, curdled, currants, cyanide generators, dairy, dairy machinery, ddt, dehydrated, demersal, demersal fish, desiccated, dextrose, diammonium phosphate, diazines, diazoles, dieldrin, dinitroanilines, dinoseb, dinoseb acetate, dinoseb salts, disinfectants, dissolving wood pulp, distillation, distilled alcoholic, dithiocarbamates, dnoc, doughs, dregs from brewing, drinks, dry buttermilk, dry salted, duck, ducks, edible, edible ice, edible oil, eggplants, eggs, eggs in the shell, essential goods, essential items, essential product, esters, ethylene dibromide, ethylene dichloride, farm, fats, fats of animal, fatty acids, fatty substance residues, feed, feed minerals, feed supplements, feeding stuff, fennel,

fermented, fermented rice, fertili, fertilizers, fertilizers manufactured, fibre crops, fibre crops nes, fibre furnish, fibre pulp, fibreboard, figs, figs dried, fish, fish meal, fixed vegetable oils, flax fibre, flax fibre raw, flax tow waste, flour, fluoroacetamide, fodder, folding boxboard, fonio, food, food excl fish, food prep, food preparations, food wastes, forage, forage products, forest, forest land, forest products, freshwater fish, fructose, fruit, fruits, fungicides, game meat, garlic, geese, ghee, gherkins, ginger, ginning, glucose, gluten, goat, goat meat, goat milk, goats, goose, gooseberries, gourds, grain, grape, grapefruit, grapes, graphic papers, grasses, grassland, greasy, ground rock phosphate, groundnut, groundnut cake, groundnut oil, groundnuts, guavas, guinea fowl, guinea fowls, gums, gums natural, hair waste, ham, hard fibres, hardboard, harvester, hazardous pesticides, hazelnuts, hch, hemp tow waste, hempseed, hen eggs, heptachlor, herbicides, hexachlorobenzene, hides, homogenized preparations, honey, hops, horse, horse beans, horses, husks, hypercalcaemics, ice cream, industrial roundwood, infant food, inland water, insecticides, insulating board, irrigat, juice, jute, kapok, kapok fibre, kapok fruit, kapokseed in shell, kapokseed shelled, karite nuts, kiwi fruit, kola nuts, kolanuts, lactose, land, land area, land use, lard, leeks, legumes, leguminous, leguminous vegetables, lemon, lemons, lentils, lettuce, limes, linseed, live animals, liver, liver chicken, liver duck, liver geese, liver oil, livestock, llamas, logging, logs, lucerne, lumber, lupins, macaroni, maize, maize germ oil, malt, malt extract, mandarines, mandarins, mangoes, mangosteens, manila fibre, manure spreaders, maple sugar, margarine, marine fish, maté, mate extracts, meal, meat, meat bovine fresh, meat indigenous, meat meal, meat of swine, meat poultry fresh, meat preparations, meat prepared pres, meat sheep fresh, mechanical wood pulp, melons, melonseed, methamidophos, milk, milk condensed, milk dry, milk fresh, milking, milking machines, millet, mineral oils, miscellaneous food, mixed grain, mixes, molasses, molluscs, monoammonium phosphate, monocrotophos, morpholines, mule, mules, mushrooms, mustard, mustard cake, mustard oil, mustard seed, mustardseed, mutton,

narcotics, natural phosphates, natural potassic salts, natural rubber, natural sodium nitrate, naturally regenerated forest, nectarines, nitrogen, nitrogenous fert, nitrogenous fertilizers, non alcoholic, nutmeg, nuts, oats, oats rolled, of buffalo milk, offals, offals edibl fresh, ofland, oil palm fruit, oilcrops, oilcrops oil, oilseed cake, oilseed cake meal, oilseed cakes, oilseeds, okra, olive, olive oil, olive residues, olives, olives preserved, onions, orange, oranges, organo, ovine meat, oxirane, paddy, palm, palm fruit, palm kernel, palm kernels, palm oil, palmkernel cake, palmkernel oil, papayas, paperboard, papers packaging, parathion, particle board, particles, pastry, pastures, peaches, peanut butter, pearled, pears, peas, pedestrian controlled tractors, peeled, pelagic, pelagic fish, pellets, pentachlorophenol, pepper, peppermint, peppers, permanent crops, permanent meadows, persimmons, pestic, pesticides, pet food, phenoxy hormone products, phosphamidon, phosphate fertil, phosphate fertilizers, phosphate rock, phosphates compounds, phosphoric acid, phosphorus compounds, pig, pig sausages, pigeon peas, pigeons, pigmeat, pigs, pimento, pineapple, pineapples, pineapples canned, pistachios, plant growth regulators, plantains, plantation, planted forest, ploughs, plum, plums, plums dried, plywood, pome, pomelos, popcorn, poppy, poppy seed, pork, potash, potash fertilizers, potassium chloride, potassium nitrate, potassium sulphate, potato offals, potatoes, poultry, poultry birds, poultry meat, powder, products of natural constituents, pulp for paper, pulp of fruit, pulpwood, pulses, pumpkins, pyrethroids, pyrethrum, quinces, quinoa, rabbit, rabbits, raisins, ramie, rapeseed, raspberries, recovered fibre pulp, recovered paper, rice, rice –, rice bran, ricebran oil, roasted, rodenticides, rodents, root or tuber harvesting machines, roots, roundwood, rubber, rubber natural dry, rye, safflower, safflower seed, salt, salts of pentachlorophenol, satsumas, sawlogs, sawnwood, seafood, seed, seed cotton, seed treatm fungicides, seed treatm insecticides, seedcotton, seeders, sesame, sesame seed, sesameseed cake, sesameseed oil, shallots, sheep, sheep milk, silage, silk, silk raw, single superphosphate, sisal, skimmed condensed, skimmed cow, skimmed cow milk, skimmed dried, skimmed

evaporated, skins, sloes, sodas, sodium nitrate, soil machinery, sorghum, sour cherries, soy, soya curd, soya paste, soya sauce, soyabean cake, soyabean oil, soyabeans, soybean, soybeans, spices, spinach, squash, starch, starchy roots, stillingia oil, stimulants, stone fruit, straw husks, strawberries, string beans, substitutes containing coffee, sugar, sugar beet, sugar cane, sugar confectionery, sugar crops, sugar raw centrifugal, sugar refined, sulfonyl ureas, sunflower, sunflower seed, sunflowerseed cake, sunflowerseed oil, superphosphate, sweet corn frozen, sweet corn prep or preserved, sweet potatoes, sweeteners, swine, syrup, syrups, tallow, tallowtree seed, tangerines, taro , tea , textile, textile fibres, threshers, timber, tobacco, tobacco products, tomato, tomatoes, treenuts, triazines, triazoles, triazoles diazoles, tributyltin compounds, triticale, tropical fresh, truffles, tuber dry equiv, tubers, tung nuts, turkeys, turnips, turnips for fodder, unbleached sulphate pulp, unbleached sulphite pulp, uncoated mechanical, uncoated woodfree, uracil, urea, urea derivates, vanilla, veal sausages, vegetable, vegetable oil, vegetable oils, vegetable origin, vegetable products, vegetable tallow, vegetables, vegetables fresh, vegetables in vinegar, vegetal products, veneer logs, veneer sheets, vermouths, vetches, virgin, vitamins, wafers, walnuts, waste, water, watermelons, waters, waxes vegetable, weat, wet salted, wheat, whey, whole condensed, whole cow milk, whole dried, whole evaporated, whole fresh buffalo, whole fresh camel, whole fresh cow, whole fresh goat, whole fresh sheep, wine, wood, wood charcoal, wood fuel, wood fuel trd, wood pellets, wood pulp, wood pulp exc mechanical, wood residues, wool, wrapping papers, yams, yautia, yoghurt"
