## Abstract

With the development of pervasive and ubiquitous computing, of IoT and personal devices, user-centric solutions will be the paradigm for most of the future applications. In this context, user-centric solutions must be proposed from deployment models to the content management. Obviously suitable Security, Privacy and Trust (SPT) solutions have to be proposed to ensure the smooth operation of systems and their straightforward managements required for a successful mass-user adoption. In this paper, we summarize the literature related to user-centric SPT scenarios and present a selection of the most recent advances in these areas.

*Keywords:* User-centric Solutions, Security, Privacy, Trust

---

## 1. Introduction

2 In future computing environments, due to the ongoing development of  
3 pervasive and smart technologies, movement towards user-centric solutions  
4 is paramount. The frameworks for everyday personal computing devices, in-  
5 cluding smartphones and smart cards, are becoming user-centric instead of  
6 issuer-centric [1]. User-centric solutions can target a wide range of applica-  
7 tions, from individual devices communicating with other connected devices,  
8 through to data-sharing in cloud computing and open grids on very power-  
9 ful computing systems. User-centric solutions address the devices and the

10 ways in which they communicate, i.e. networks and end-user applications.  
11 The key factor in the success of user-centric solutions is the convenience for  
12 users; to achieve this Security, Privacy and Trust (SPT) in the user-centric  
13 ecosystem for any device must be ensured.

14 Until now, very few pieces of work related to user-centric SPT have been  
15 published in various journals and conferences; to cite a few in different do-  
16 mains:

- 17 • Castiglione *et al.* [2] propose secure group communication schemes in  
18 user-centric networks. They focus their attention on key predistribu-  
19 tion for secure communications in those networks and introduce in-  
20 troduce Multi-PRSA, a novel scheme which efficiently extends and im-  
21 proves Polynomial Predistribution Random Subset Assignment Scheme  
22 (PRSA), in order to increase resilience against collusion attacks.
- 23 • De las Cuevas *et al.* [3] introduce a novel self-adaptive user-centric  
24 end-to-end system, named Multi-platform Usable Endpoint Security  
25 (MUSES) to securely manage Bring Your Own Device (BYOD) envi-  
26 ronment. MUSES considers users behavior in order to adapt, improve,  
27 and even increase the defined set of security rules. To do this, the  
28 system applies Machine Learning and Computational Intelligence tech-  
29 niques, being also able to predict future security incidences produced  
30 by these users.
- 31 • Gubbi *et al.* [4] present a user-centric cloud centric vision for world-  
32 wide implementation of Internet of Things in which associated chal-  
33 lenges have been highlighted ranging from appropriate interpretation  
34 and visualization of the vast amounts of data, through to the privacy,  
35 security and data management issues that must underpin such a plat-  
36 form in order for it to be genuinely viable.
- 37 • Sánchez-García *et al.* [5] propose On-SiteDriverID, a secure authentica-  
38 tion scheme based on Spanish eID cards for vehicular ad hoc networks,  
39 which has a user-centric design for road authorities point of view. They  
40 have conducted an evaluation of the proposal on simulated realistic  
41 VANET urban scenarios over a map of the city of Barcelona.
- 42 • Akram *et al.* [6] discuss two of the most widely accepted and deployed  
43 smart card management architectures in the smart card industry: Glob-  
44 alPlatform and Multos and explain how these architectures do not fully

45 comply with the User Centric Smart Card Ownership Model (UCOM)  
46 and GlobalPlatform Consumer-Centric Model (GP-CCM). They then  
47 design a novel flexible consumer-centric card management architecture  
48 designed specifically for the UCOM and GP-CCM frameworks, along  
49 with ways of integrating the Trusted Service Manager (TSM) model  
50 into the proposed card management architecture whilst addressing the  
51 potential security issues.

- 52 • Vossaert *et al.* [7] present a user-centric identity management using  
53 trusted modules that tackles several privacy and security problems of  
54 current federated identity management systems (FIMs) and also adds  
55 extra functionality.
- 56 • Henze *et al.* [8] present User-driven Privacy Enforcement for Cloud-  
57 based Services in the IoT (UPECSI), a solution which takes a compre-  
58 hensive approach to privacy for the cloud-based IoT by providing an  
59 integrated solution for privacy enforcements that focuses on individual  
60 end-users and developers of cloud services at the same time. UPECSI  
61 enables individual end-users to protect their potentially sensitive data  
62 before it is transferred to the cloud; empowers cloud service developers  
63 to efficiently integrate privacy functionality into the development pro-  
64 cess of a cloud service; and provides users an intuitive, adaptable, and  
65 transparent user interface which allows them to configure their privacy  
66 settings based on their individual privacy experience.
- 67 • Suriadi *et al.* [9] propose an extension of the existing federated single  
68 sign-on (FSSO) systems that adopts the beneficial properties of the  
69 user-centric identity management (UCIM) model. This new identity  
70 management system allows the users to control and enforce their pri-  
71 vacy requirements while still retaining the convenience of single sign-on  
72 over a federation of service providers.
- 73 • Schreckling *et al.* [10] introduce Kynoid, a real-time monitoring and  
74 enforcement framework for Android. It is based on user-defined security  
75 policies which are defined for data-items. This allows users to define  
76 temporal, spatial, and destination constraints which have to hold for  
77 single items.
- 78 • Jin *et al.* [11] propose a unified access control scheme that supports  
79 patient-centric selective sharing of virtual composite Electronic Health

80 Records (EHRs) using different levels of granularity, accommodating  
81 data aggregation and privacy protection requirements.

- 82 • Frangoudis *et al.* [12] focus on the provision of secure, user-centric voice  
83 services and explore their potential performance-wise, by designing a  
84 VoIP communications scheme tailored to open-access wireless environ-  
85 ments.

86 The aims of this special issue being to gather and foster researches on this  
87 key topic of user-centric solutions, authors have been invited to submit orig-  
88 inal research papers on the state of the art, latest results and advances in  
89 SPT solutions for user-centric devices, network and applications, highlighting  
90 trends and challenges. Topics of this special issue included:

- 91 • Security, Privacy and Trust of:
  - 92 – User-centric Devices (Smartphones, PDA, RFID, Sensors, Smart  
93 Cards, Smart Cameras, Smart Objects),
  - 94 – User-centric Networks (Mobile Ad hoc Networks, M2M Networks,  
95 Urban Networks, Wireless Sensor Networks),
  - 96 – User-centric Applications (Cloud Computing, Data Provenance,  
97 Smart Grids, Smart Homes, Healthcare, Smart Spaces, Conver-  
98 gent Pervasive and Smart Environments);
- 99 • Technologies used to enhance Security, Privacy and Trust in User-  
100 centric solutions (NFC, IPv6, TPM);
- 101 • Societal issues related to Security, Privacy and Trust in User-centric  
102 solutions (HCI, User interactions).

103 After a rigorous review process, among the 73 very high quality submis-  
104 sions received, only 18 papers have been accepted for publication in this  
105 issue.

## 106 2. Content of this issue

107 In this special issue, the accepted papers are either related to domains of  
108 application, like finance or healthcare, either they are dealing with malware  
109 detection and security of mobile applications. Some selected papers are re-  
110 lated to users' privacy or to secure resource/data-sharing solutions whereas  
111 few others address miscellaneous close topics.

112 *2.1. SPT in financial domain*

113 The first paper, “Proactive user-centric secure data scheme using attribute-  
114 based semantic access controls for mobile clouds in financial industry” by Qiu  
115 *et al.* [13] proposes an approach to proactively protect financial customers  
116 privacy information using Attributed-Based Access Control (ABAC) as well  
117 as data self-deterministic scheme.

118 The second paper, “Evaluation of transaction authentication methods for  
119 online banking” by Kiljan *et al.* [14] studies the online banking authentica-  
120 tions in a user-centric context and proposes to extend an existing mechanism  
121 which quantifies accessibility, memorability, security and vulnerability char-  
122 acteristics, with aspects related to the feasibility dimension of secure usability  
123 of transaction authentication methods.

124 The third paper, “Secure and anonymous decentralized Bitcoin mixing”  
125 by Ziegeldorf *et al.* [15] proposes CoinParty, an efficient decentralized mix-  
126 ing service that allows users to reestablish their financial privacy in Bitcoin  
127 and related cryptocurrencies. Through a novel combination of decryption  
128 mixnets with threshold signatures, CoinParty takes a unique place in the  
129 design space of mixing services, combining the advantages of previously pro-  
130 posed centralized and decentralized mixing services in one system.

131 *2.2. SPT in healthcare domain*

132 The fourth paper, “On the design and analysis of protocols for Personal  
133 Health Record storage on Personal Data Server devices” by Belyaev *et al.* [16]  
134 proposes a new architecture, namely Personal Data Server (PDS) overlay,  
135 where the electronic Personal Health Records (PHRs) data is stored on a set  
136 of Secure Portable Tokens (SPTs, *i.e.* cheap, portable, and secure devices  
137 combining the computing power and tamper-resistant properties of the smart  
138 cards and the storage capacity of NAND flash memory chips and being able  
139 to act as a PDS) that are under the control of individual users. A formal  
140 analysis is also provided to ensure the correct behavior of the protocols used  
141 in PDS overlays.

142 The fifth paper, “A robust and anonymous patient monitoring system  
143 using wireless medical sensor networks” by Amin *et al.* [17] proposes an  
144 architecture for patient monitoring health-care system in wireless medical  
145 sensor networks and designs an anonymity-preserving mutual authentication  
146 protocol for mobile users. The AVISPA tool is used to simulate the proposed  
147 protocol and demonstrates it resists the existing well known attacks.

148 *2.3. SPT for malware detection and mobile applications*

149 The sixth paper, “Owner based malware discrimination” by Han *et al.* [18]  
150 introduces the relativity issue of discrimination technique and proposes a ma-  
151 licious software discrimination model, named as Unlimited Register Machine  
152 of Owners (URMO) which includes analyzing and defining operations and  
153 objects as two elements of discrimination, introducing the concept of owner  
154 to give a reference to malicious signature, and comparing the model of Un-  
155 limited Register Machine (URM) with URMO to explain the origin of false  
156 positive and false negative.

157 The seventh paper, “Risk analysis of Android applications: A user-centric  
158 solution” by Dini *et al.* [19] presents a framework, called Multi-criteria App  
159 Evaluator of TRust for AndROID (MAETROID), to evaluate the trustwor-  
160 thiness of Android apps by performing a multi-criteria analysis of an app  
161 at deploy-time and returning a single easy-to-understand evaluation of the  
162 apps risk level (*i.e.*, Trusted, Medium Risk, and High Risk) to help the user  
163 deciding on whether or not installing a new app.

164 The eighth paper, “Automatic security verification of mobile app con-  
165 figurations” by Costa *et al.* [20] proposes a novel technique for the security  
166 verification of groups of mobile app whose the approach relies on partial  
167 model checking (PMC) to extend the existing security guarantees to groups  
168 of applications.

169 The ninth paper, “You can’t touch this: Consumer-centric android appli-  
170 cation repackaging detection” by Gurulian *et al.* [21] proposes an approach  
171 for detecting repackaged applications by taking advantage of the attackers  
172 reluctance to significantly alter the elements that characterise an application  
173 without notably impacting the applications distribution.

174 *2.4. SPT for users’ privacy*

175 The tenth paper, “Your WiFi is leaking: What do your mobile apps gossip  
176 about you?” by Atkinson *et al.* [22] describes how mobile device apps can  
177 inadvertently broadcast personal information through their use of wireless  
178 networks despite the correct use of encryption and they present a remote,  
179 undetectable, detection mechanism to infer private user information through  
180 observation of encrypted app network activity.

181 The eleventh paper, “Time-based low emission zones preserving drivers  
182 privacy” by Jardí-Cedó *et al.* [23] presents a new user-centric Electronic Road  
183 Pricing (ERP) system for Low-Emission Zones (LEZs) that preserves the

184 privacy of honest drivers and that is able to detect fraudulent drivers and  
185 revoke their anonymity.

### 186 2.5. SPT for resource/data-sharing solutions

187 The twelfth paper, “XSACd-Cross-domain resource sharing & access con-  
188 trol for smart environments” by Fysarakis *et al.* [24] presents XSACd, a  
189 cross-domain resource sharing and access control framework for smart envi-  
190 ronments, combining the well-studied fine-grained access control provided by  
191 the eXtensible Access Control Markup Language (XACML) with the benefits  
192 of Service Oriented Architectures, through the use of the Devices Profile for  
193 Web Services (DPWS). Based on standardized technologies, this framework  
194 enables seamless interactions and fine-grained policy-based management of  
195 heterogeneous smart devices, including support for communication between  
196 distributed networks, via the associated MQ Telemetry Transport protocol  
197 (MQTT) based proxies.

198 The thirteenth paper, “AFT: Adaptive and fault tolerant peer-to-peer  
199 overlay - A user-centric solution for data sharing” by Poenaru *et al.* [25] pro-  
200 poses AFT, an overlay that adapts to a changing number of nodes, which  
201 is resilient to faults and the foundation for an efficient implementation of a  
202 reputation based trust system. The AFT overlay is designed to be a solution  
203 for systems that need to share transient information, performing a synchron-  
204 ization between various components, like in mobile ad-hoc networks, M2M  
205 networks, urban networks, and wireless sensor networks.

### 206 2.6. Miscellaneous SPT of user-centric solutions

207 The fourteenth paper, “Trusted mobile computing: An overview of exist-  
208 ing solutions” by Bouazzouni *et al.* [26] presents a comprehensive surveys of  
209 the hardware-based (Secure Elements, Trusted Platform Module and Trusted  
210 Execution Environments) and software-based (Virtualization Environments)  
211 solutions for trusted mobile computing.

212 The fifteenth paper, “A Sybil attack detection scheme for a forest wildfire  
213 monitoring application” by Jan *et al.* [27] proposes two different techniques  
214 for Sybil attack detection for a forest wildfire monitoring application. The  
215 first one is a two-tier detection technique which uses high-energy nodes op-  
216 erating at a lower level to detect forged identities of Sybil nodes. The second  
217 one is a residual energy-based detection technique which uses the residual  
218 energy of each node to detect a possible Sybil attack at the high energy  
219 nodes.

220 The sixteenth paper, “HB<sup>+</sup>DB: Distance bounding meets human based  
221 authentication” by Pagnin *et al.* [28] proposes to mitigate the man-in-the-  
222 middle attack against HB+ protocol by using physical layer measures from  
223 distance-bounding protocols and simple modifications to devices radio re-  
224 ceivers.

225 The seventeenth paper, “Full integrity and freshness for cloud data” by  
226 Jin *et al.* [29] presents the design, implementation and evaluation of such a  
227 secure storage system where confidentiality, full integrity and instantaneous  
228 freshness check are achieved.

229 The eighteenth paper, “A novel face recognition algorithm via weighted  
230 kernel sparse representation” by Liu *et al.* [30] proposes a novel face recogni-  
231 tion algorithm called Weighted Kernel Sparse Representation based Classifi-  
232 cation (WKSRC) whose experiments on the AR database reveal, it is more  
233 effective than SRC, WSRC and KSRC in term of recognition accuracy and,  
234 especially, it has better ability to deal with the occlusion scene.

### 235 **3. Conclusion**

236 Security, privacy and trust in many aspects cannot be envisioned as solely  
237 technical problems. Individual users that interact with the modern technol-  
238 ogy, have to taken in as equal partners to build a holistic system that pro-  
239 vides foolproof security, privacy and trust mechanisms. Therefore, there is an  
240 emerging trend in the technology sphere especially and information security  
241 particularly, of developing technical solutions that involve, and empower its  
242 users. This trend has the potential to solve not only the present challenges  
243 but also the future challenges posed by emerging technologies like IoT, au-  
244 tonomous systems (transports, cars, drones) and Artificial Intelligence (AI).  
245 This paper has charted a small sample of this trend and its potential for the  
246 future.

### 247 **Acknowledgments**

248 We would like to thank all authors who submitted their papers, and all  
249 the reviewers for their time and effort. Their thorough reviews and valuable  
250 comments enabled us to select the papers, and provide a high quality Special  
251 Issue. We would also like to thank the FGCS Editor-in-Chief, Professor Peter  
252 Slood, and the Elsevier staff for their help and support that made this Special  
253 Issue possible. We hope this Special Issue will serve as a reference for many  
254 future research projects.
